Fazit

f c e o r d

Mitarbeiter mit ausgeprägten kognitiven Fähigkeiten sind ein Wettbewerbsvorteil für ein Unternehmen – insbesondere dann, wenn es sich um Aufgaben handelt, die schnelles Lernen, erstmalige Problemlösung und den Umgang mit Mehrdeutigkeiten erfordern oder es um Fragen geht, die aus dem Stegreif zu beantworten sind.

Menschen, die bei Tests zu kognitiven Fähigkeiten gut abschneiden, entwickeln mit größerer Wahrscheinlichkeit schneller ein größeres Wissen über den Job, treffen effektivere Entscheidungen und können erfolgreicher Probleme lösen und Strategien entwickeln.

“)UMHGHERE□..
~~EMWQFHQ~~

ist die allgemeine kognitive Fähigkeit, nicht I.Q. Es ist die Lernfähigkeit. Es ist die Fähigkeit, sofort das Gelernte zu verarbeiten. Es ist die Fähigkeit, unterschiedliche Informationen zu verknüpfen und in Bezug zu setzen.

Eine Herausforderung für Führung - und Organisation

Sowohl Erfahrung als auch Lernpotenzial sind wichtige Faktoren dafür, wie effektiv Menschen mit schnellen Veränderung und zunehmender Komplexität umgehen. Erfahrung entwickelt sich aus unterschiedlichen Bereichen der Bildung, des Wissens, des Arbeitstrainings und der Arbeitserfahrung über einen Zeitraum hinweg. Das Lernpotenzial umfasst dagegen Eigenschaften, die im Zeitverlauf stabil sind, wie etwa Persönlichkeitsmerkmale, Werte und Intelligenz.

Angesichts der heutigen Komplexität und des Wandels, müssen die Geschäftsführer sowohl das Wissen, das sie im Laufe der Zeit aufgebaut haben, als auch ihre geistigen Fähigkeiten und Beweglichkeit nutzen, um kluge, durchsetzungsfähige Entscheidungen zu treffen. Entscheidend ist aber auch, dass sie im gesamten Unternehmen Mitarbeiter haben, die über die kognitiven Fähigkeiten verfügen, um diese Entscheidungen dann auch umzusetzen. Hier beginnt die Arbeit der HR.

Im Besonderen verlassen sich Geschäftsführer auf ihre HR-Partner, um eine Strategie zur Talentsuche zu entwickeln, die intelligente, agile und flexible Denker findet. Heute ist es wichtig, Mitarbeiter zu haben, die sich schnell anpassen und in einem Umfeld voller schneller Veränderungen Erfolg haben. Dazu braucht es Mitarbeiter, die sich schnell neue Fähigkeiten aneignen können, die für effektive Leistung oder Aufstieg erforderlich sind. Darüber hinaus besteht die Aufgabe der HR Abteilung darin, genau die Talente zu entwickeln, die über hohe kognitive Fähigkeiten verfügen. D.H. sie muss leistungsstarke Mitarbeiter, die sich aufgrund ihrer kognitiven Eigenschaften als Kandidaten für Führungspositionen in der Zukunft eignen und sowohl die Erfahrung als auch das kognitive Potenzial für interne Beförderungen und Nachfolgefähigkeiten haben, identifizieren.

In der Regel reicht es nicht mehr aus, zwei bis drei Schlüsseltechnologien zu beherrschen. Die Mitarbeiter von heute müssen aufgeweckt und clever sein, um viele neue Technologien zu erlernen und anzuwenden – und das fast über Nacht. Noch wichtiger ist, dass sie die neuen Technologien nutzen müssen, um neue Werte für das Unternehmen und seine Kunden zu schaffen.

"Geschäftsführer müssen sowohl ihr Wissen, als auch ihre geistige Beweglichkeit nutzen, um kluge, durchsetzungsfähige Entscheidungen zu treffen."

All das führt zu einer doppelten Herausforderung:

- Erstens: die richtigen Personen auswählen, um diese dann in Führungs- und Managementrollen oder Expertenrollen zu entwickeln, die für das Unternehmen erfolgsentscheidend sind.
- Zweitens: Sicherstellen, dass auch die Mitarbeiter im Hintergrund der Organisation über die kognitiven Fähigkeiten verfügen, um ihre Jobs auf zufriedenstellendem Niveau zu erfüllen.

Glücklicherweise können Sie durch die effektive Beurteilung des kognitiven Potenzials beiden Herausforderungen, für die Führungs- und Expertenebene wie für das ganze Team meistern.

³17th Annual Global CEO Survey, PricewaterhouseCoopers, 2014

THE RIGHT MIX: HIGH POTENTIAL/HIGH FIT

If you only hired the smartest, most-ambitious people you could find, you would soon have a disaster on your hands - widespread disengagement and high levels of turnover. If you filled your organisation with high-performers, for example, you could only promote a given number of them despite how brilliantly they all performed. Over time, the many who weren't promoted would become frustrated and feel they're not properly valued. According to a CIPD Employee Outlook study⁴, 30% of employees believe they're overqualified for the job they do, with only 24% satisfied with their jobs.

That's why, along with having employees who have the cognitive potential to be leaders in your organisation, you also need a good supply of employees whose cognitive potential fits the cognitive demands of lower and mid-level roles, especially those where there is little or no potential for advancement. By knowing people's potential for new learning and dealing with complexity, you can fit them into roles where they will be satisfied, challenged but not overwhelmed and feel that they are making a valuable contribution - this has a significant impact on employee satisfaction and engagement. This in turn helps you forge teams that are more satisfied, engaged and stable, creating a strong, proficient "backbone" in the organisation.

Ultimately, getting the cognitive mix just right ensures that your organisation not only has a high potential talent pool that is ready to advance, take on new learning fast and fill more complex roles, but also a 'backbone' talent pool that provides critical stability in roles where there is not potential for rapid advancement.

MULTI-GENERATIONAL WORKFORCES, TRAINING AND VIRTUAL WORK

A combined focus on cognitive potential and fit can also help you solve other organisational challenges associated with change and increased complexity:

1. IT HELPS YOU HAVE MORE SUCCESS FITTING MULTIPLE GENERATIONS INTO YOUR ORGANISATION

Finding and retaining quality workers is one of the well-known problems for businesses today - and it's key to acknowledge that with such stark differences between current generations, we are going to have one of the most diverse workforces ever seen – By 2020, millennials will make up 35% of the total working population and Gen Z will make up 24%⁵. Plus, they're also a relatively untapped source of labour with the rate of unemployed young people more than three times higher than the figure for older generations⁶.

There are great benefits to hiring young people. They bring untapped passion, energy and potential and may be willing to work on contract initially, which reduces labour costs. Plus, Gen Z are being described as 'digital natives'. Those in Gen Z who have grown up in regions with internet connectivity and easy access to mobile devices seem to take more naturally to this technology. But growing up with constant connectivity and mobile devices doesn't necessarily translate into work skills. Therefore, the limitation here is their lack of work training and experience. With work performance largely a combination of experience and cognitive ability, it's critical to assess candidates' cognitive potential - which impacts how well and how quickly they'll get up to speed and reach proficiency with their job duties and demands. In addition to helping you determine if they can succeed in a role, their cognitive potential shows you how they are likely to fit within your organisation going forward, whether they'll be solid contributors, and how likely they are to advance to more demanding roles.

2. IT IMPROVES YOUR TRAINING RESULTS

Training is important to all organisations, but it is often time-consuming and costly and some people always fail despite your best efforts. Getting better training results is of tremendous value and assessing for cognitive potential and fit delivers them. Knowing an individual's cognitive ability is an indicator of how well they will cope with training and new learning. By identifying this upfront, training programs can be aligned with individual needs and managers can tailor their support and coaching. In roles that have a steep learning curve, significant complexity and a need for the individual to work independently, having strong cognitive capability is a differentiator. As an Oracle report⁷ noted, "A shorter time to proficiency for new hires can mean more products developed, more services delivered, more orders filled, more deals in the pipeline, and/or more marketing activity."

3. IT HELPS YOU UNDERSTAND HOW PEOPLE WILL RESPOND TO A VIRTUAL WORK ENVIRONMENT

Some people succeed when working remotely, while others struggle. It's important to recognise which people have the right cognitive fit for the demands of virtual work. By understanding workers' cognitive potential and learning agility, you can identify employees who are fast and agile learners and who can work with less supervision - critical success factors for an effective virtual worker, especially as the percentage of remote workers continues to rise.

MEASURING LEARNING AGILITY

The General Intelligence Assessment (GIA) is a cognitive ability assessment that provides an accurate prediction of the time it will take someone to get to grips with a new role, skill, process etc. This assessment measures what a person could potentially do, rather than their existing knowledge.

The GIA consists of five tests of simple cognitive abilities (i.e. abilities that rely on processes such as thought, language, decision making, learning and memory). By gauging an individual's capabilities in these five areas, you will be able to keep your people engaged in their work and your organisation with appropriate challenges suited to their strengths. The GIA will also enable you to identify potential leaders, those that can think on their feet and the people better suited to methodical problem solving.

Spatial Visualisation

This test measures the ability to create and manipulate mental images of objects. This test correlates with tests of mechanical reasoning, and assesses an individual's ability to use mental visualisation skills to compare shapes. It relates to the ability to work in environments where visualisation skills are required to understand and execute tasks.

Reasoning

This test measures the perception of inaccuracies in written material, numbers and diagrams, the ability to ignore irrelevant information, the ability to recognise similarities and differences, and error checking. It tests the speed of semantic encoding and comparison.

Perceptual Speed

This test measures the ability to make inferences, the ability to reason from information provided and to draw the correct conclusions. This test assesses the ability of an individual to hold information in their short-term memory and solve problems.

Number Speed & Accuracy

This test measures the ability to create and manipulate mental images of objects. This test correlates with tests of mechanical reasoning, and assesses an individual's ability to use mental visualisation skills to compare shapes. It relates to the ability to work in environments where visualisation skills are required to understand and execute tasks.

Word Meaning

This test assesses word knowledge and vocabulary. It assesses the comprehension of a large number of words from different parts of speech and the ability to identify the words that have similar or opposite meanings. It assesses the ability to work in environments where a clear understanding of written or spoken instructions is required.

Reliability and validity

The GIA was developed over 15 years by Dr Peter Dann in the Human Assessment Laboratory at the University of Plymouth. The GIA has been subject to rigorous scientific testing to determine its reliability and validity as a psychological assessment. Various research studies have shown that the GIA is a consistent and valid measure of trainability. The GIA is registered with the British Psychological Society (BPS) after it was audited against the technical criteria established by the European Standing Committee on Tests and Testing, part of the European Federation of Psychologists' Associations.

CLIENT CASE STUDY: SILVERLAKE AUTOMOTIVE RECYCLING

Established in 1946, Silverlake Automotive Recycling is one of the UK's leading vehicle recycling, dismantling, scrapping and recovery companies.

THE CHALLENGE

Following significant investment to expand in their market and achieve high growth, Silverlake needed to expand its workforce; the company needed to make sure it was selecting the right type of people to fulfil the many new and varied roles in the new service areas.

If Silverlake was to access a wider talent pool and draw in people who could work in different ways, it needed to be good at attracting a younger, more diverse range of applicants. For an industry that is typically populated by older white men, this was a major challenge, which other companies in the sector struggle with.

With new vacancies opening up within the business, Silverlake also wanted to also ensure that those it already employed were in positions best suited to them – and if they weren't, it needed to smoothly redeploy them.

Lastly, once people were in place, the company wanted to ensure it maximised the return on its investment, which meant ensuring productivity levels and staff retention rates were high.

Simon Bastin-Mitchell, Commercial Manager at Silverlake says: "We didn't want a revolving door – with us spending a lot of time and money finding and recruiting great people and training them, only to see them leaving us quickly. That would be a huge drain on resources, very disruptive for our customers and very distracting for the business at a time of expansion."

THE SOLUTION

The leadership team at Silverlake decided that the key to much of this lay in better understanding how candidates and current employees behave in the work environment - their strengths, their weaknesses, and how quickly they learn new information. Armed with such insights, they would be able to improve Silverlake's recruitment process, staff engagement levels and how teams are managed. They would also be able to identify if current employees had skills better suited to other areas of the business.

After researching the most successful people assessment tools on the market, Silverlake chose Thomas International's psychometric assessments and began working with the company.

Thomas first suggested Silverlake ask its employees to take part in a Personal Profile Analysis (PPA), an eight-minute self-assessment that provides an insight into how people behave at work, as well as a General Intelligence Assessment (GIA), which delivers an accurate prediction of the time it will take someone to get to grips with a new role. This implementation was designed to identify the most suitable internal candidates for new roles and to make sure that each team member was positioned correctly within the organisation.

Having deployed these assessments with its current staff, Silverlake then used them as part of the recruitment process as it brought new people onboard. This was 10 years ago, and the business has been using these assessments ever since.

Simon Bastin-Mitchell comments: "We simply would not be where we are today without the PPA and GIA from Thomas International. The feedback that these assessments provide is invaluable. It allows the senior team to facilitate employee development, we have a better understanding of what motivates each worker, and the assessments remove all assumptions from the recruiting and redeployment processes; our decisions are rooted in science rather than being based on hunches and suppositions."

In fact, Silverlake is so committed to the assessments that six members of its senior management team have become officially accredited to feed back on the results to staff, on a one-to-one basis.

Simon explains how his accreditation has given him a deeper understanding of what the assessments can do for the organisation: "By providing the feedback ourselves, we get a greater insight into each person's motivations and behaviours. We understand how each individual should be managed, and we identify where their attributes and skills can best be utilised.

"As a result, we are able to attract and hire top quality talent and ensure everyone within the organisation is happy and satisfied within their role. The assessments have had a major impact on how we, as a business, operate, and will continue to do so as we grow further."

THE RESULT

"Introducing Thomas' assessments into the business has delivered huge benefits. We have hired great staff and the working environment is more harmonious. We have less frustrated workers who feel 'stuck' in the wrong roles. Plus, we have achieved a greater level of people awareness - employees understand themselves better and the leadership team has a much better appreciation of the team," continues Simon.

In terms of more tangible results, Silverlake has successfully expanded its employees base – it has 115 members of staff, which is up from just 60 in 2008. This is more than a 90 percent increase in just 10 years. During the same period productivity has increased by 110 percent per employee.

Not only are staff numbers and productivity up significantly, but people are also staying at Silverlake long-term. Fifty per cent of employees have been at the company between 5-10 years, with 25 per cent coming on board within the last five. This longevity of employment is no mean feat, Simon explains: "Introducing a host of new services brought with it a lot of change within the business. Other companies in similar circumstances have seen their established employees become alienated and leave, but that hasn't happened with us. That's down to the fantastic working environment we have created and by having people in roles that suit them. In an era where employees are more than happy to vote with their feet, we are seeing phenomenal retention rates from both old and recent hires, which is something we credit to the data and information produced by the PPA and GIA. It is clear that the recruitment strategy is succeeding."

Silverlake reports that since the implementation of the PPA and GIA, it has also been able to attract a younger workforce, with the average age of its staff dropping from 30 to 25 in the last five years. This has opened the business up a new talent pool and introduced a younger generation into a notoriously 'old school' industry – which is good for the business' future.

Simon concludes: "Psychometric assessments have revolutionised our recruitment process. We now know what the ideal candidate is like – and have the tools to spot them. We're no longer falling for stereotypes, instead we have a systematic approach. This has also helped us identify, attract and retain younger staff – something everyone in the industry is trying to do, but we've cracked it!"

“We’ve been using psychometric assessments for 10 years and during this time the business has grown over 300%. I’m convinced that the assessments have played a major part in this growth.”

CONCLUSION

Talent is the fuel that drives the business engine and it's on the top of the C-level agenda. To get the best results, HR needs to create a talent pipeline that serves your organisation's needs, both today and in the future.

Assessing individuals for cognitive potential and fit is a powerful tool that can have a tremendous impact on talent selection and management strategies. It allows you to fill your talent pipeline with people who represent the right mix of potential and fit for your organisation's needs both today and in the future. You can identify people – from top to bottom – whose cognitive abilities match the needs of the job, as well as some whose cognitive potential makes them good candidates for promotions when the right opportunities inevitably arrive.

Once you get this mix right, your talent pipeline will help your organisation thrive for years to come.

KEY TAKEAWAYS

CEOs rely on their HR partners to develop a talent acquisition strategy to find agile thinkers who can adapt quickly and thrive in an environment of rapid change and can also quickly learn new skills that may be required for effective performance or advancement – and identify those who require more time and provide them with the right amount of support.

It's not about hiring the best of the best because there won't be promotional opportunities for everyone. Identifying those 'backbone' employees who provide critical stability in roles where there are no opportunities for rapid advancement will improve retention and employee engagement.

It is proven that using psychometric assessments, such as Thomas' GIA can help organisations measure mental agility, understand how to develop people through training, identify potential leaders who have the skills to drive change and ensure a person is sufficiently challenged in their role.

ABOUT THOMAS

Established in 1981, Thomas International is a leading global provider of psychometric assessments and people solutions. Our tools are built on years of robust psychology to enable individuals and teams to perform at their best, help leaders to make confident people decisions and give you a comprehensive insight into what makes your people thrive, and ultimately succeed.

Used throughout recruitment, development, management and leadership, our assessments delve into a person's behaviour, personality, high potential, aptitude and ability and engagement. Supported by a team of experts, we empower organisations to transform performance, deliver confidence and achieve maximum success.
